

RetinaCare / DIRD+

Complete repository, architecture, technology, pipeline, file inventory, work attribution, build and verification report

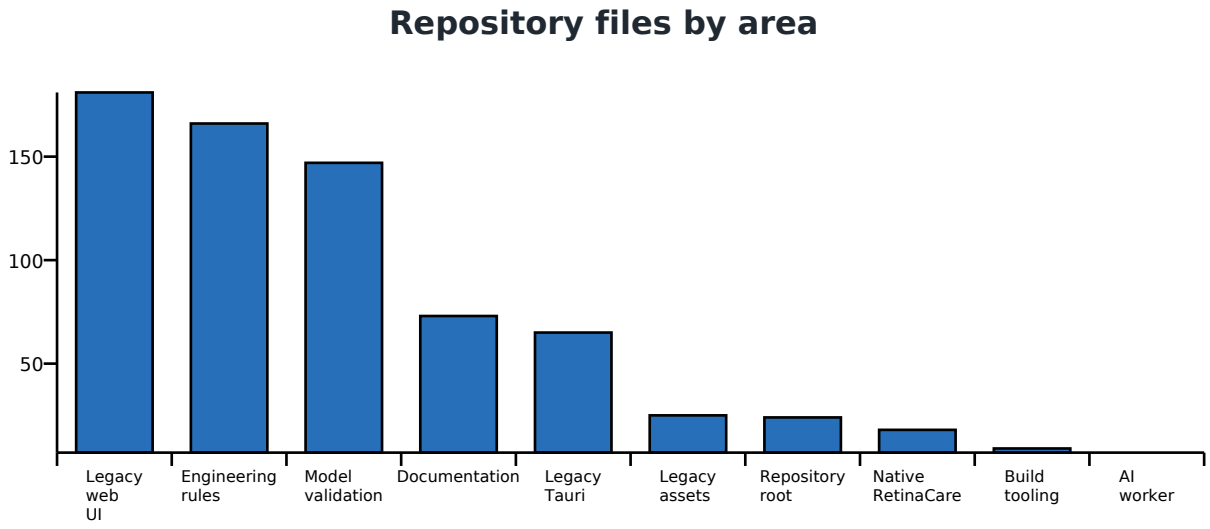

Report date	2026-10-27 17:38 IST
Repository	/home/claude/Desktop/Dird
Baseline commit	7286cf7
Inventoried files	727
Measured text lines	145,266
Working tree	Contains local RetinaCare migration changes; not committed

Evidence boundary

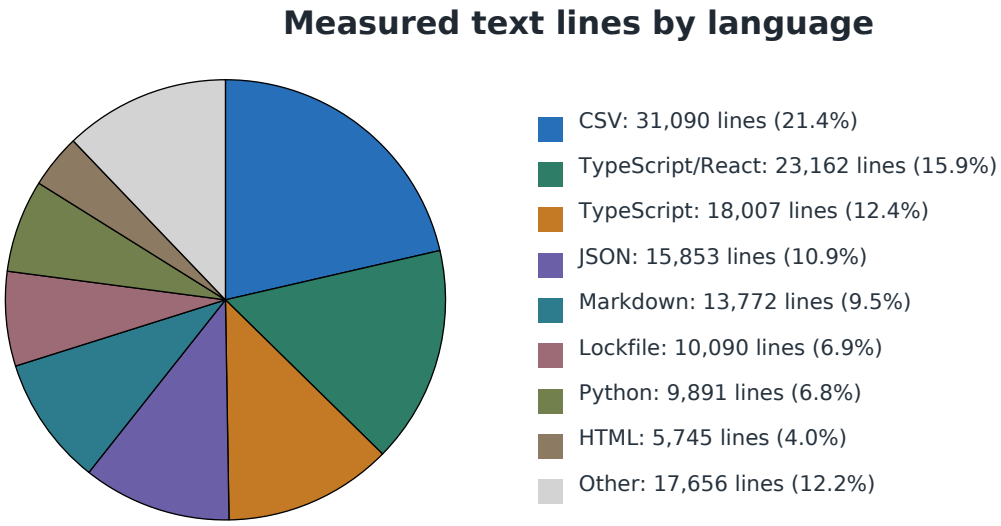

This report distinguishes verified implementation from unverified claims. No Windows execution, RTX 5070/CUDA benchmark, trained-model diagnosis, model accuracy, heatmap, or clinical outcome is asserted.

1. Executive repository overview

The working tree contains 727 source, configuration, documentation, validation, asset, and engineering-rule files after excluding generated builds, dependencies, caches, and Git internals. DIRD+ remains preserved as the legacy reference while RetinaCare is implemented beside it under native/ and ai_engine/.

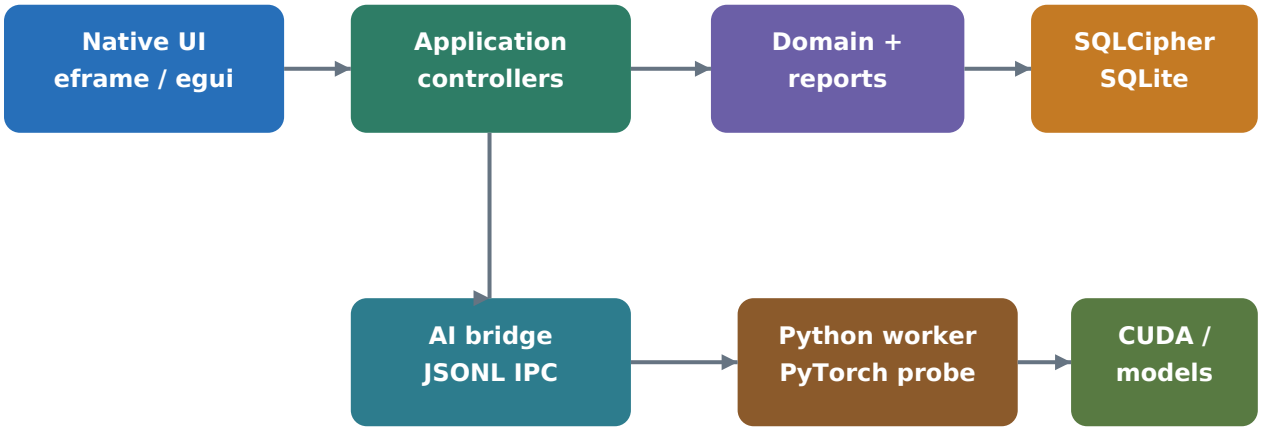

1.1 Language profile

Counts are physical text lines, not semantic lines of code. Generated dependencies and build output are excluded; checked-in validation CSV data and documentation are included and therefore visible in the distribution.

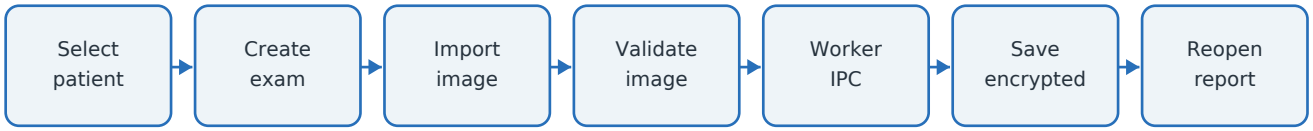

2. Architecture and runtime data flow

RetinaCare target architecture

The native UI never exposes generic SQL and does not use browser storage. Rust owns application orchestration and SQLCipher access. A persistent local Python subprocess exchanges bounded, versioned JSON Lines over stdin/stdout. No HTTP server or WebView exists in the new runtime.

Implemented local workflow

AI stage returns a truthful missing-model error until verified weights and an adapter exist.

3. What has been completed

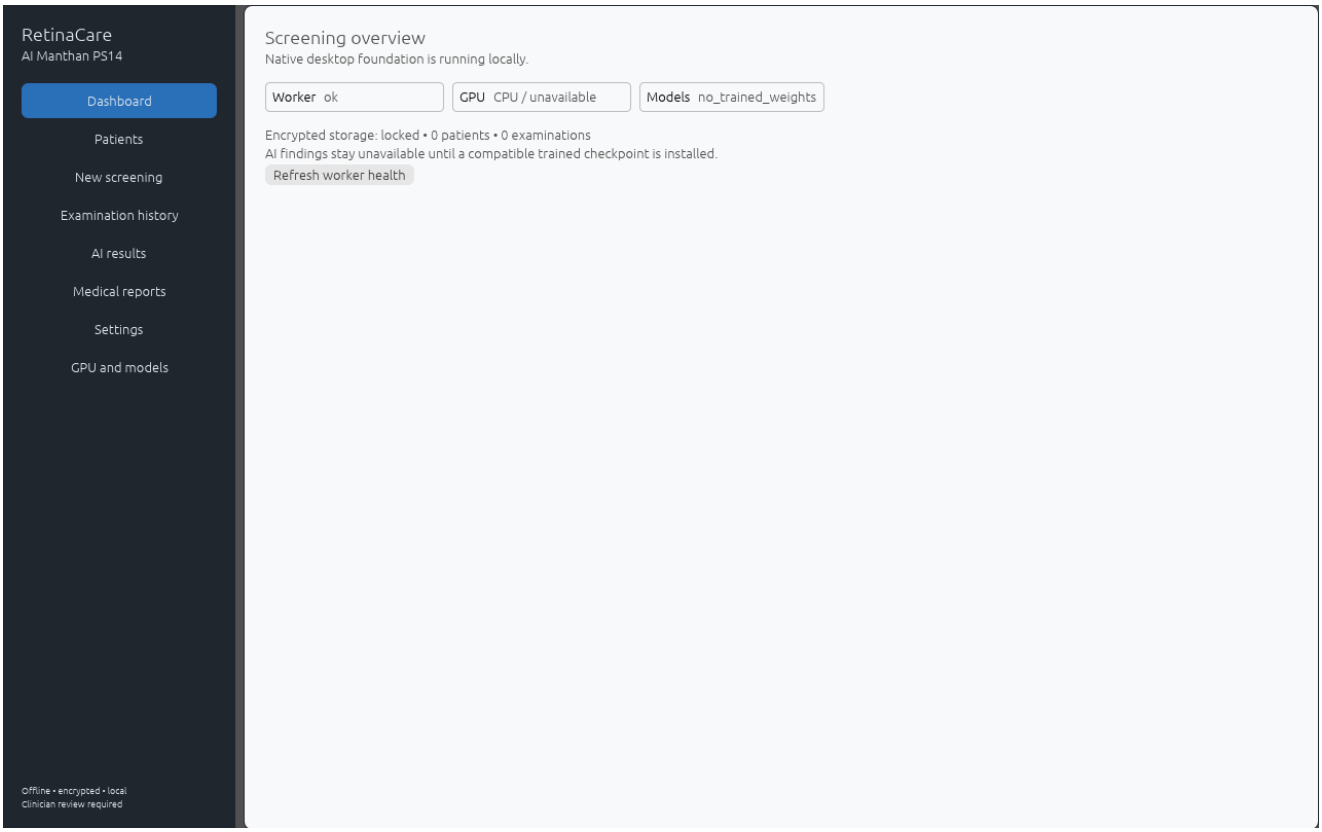

Area	Implemented and verified state
Native UI	eframe/egui entry point, icon, dark navigation, dashboard, patient registry, screening viewer, AI results, history, reports, settings, GPU/model status
Patients	Open/create encrypted database, add, edit, search, select, open records
Screening	Select patient/eye, native file picker, bounded background image decode, zoom, pan, reset, analyze request, encrypted save
AI worker	Persistent protocol, health/device probe, model discovery, preprocessing validation, timing, explicit missing-model errors
Persistence	SQLCipher, Argon2id, patient/examination records, image/eye/analysis fields, safe rekey recovery
Reports	Reopen saved examinations and real analysis payload; JSON export. PDF clinical report export is not implemented
Packaging	Ubuntu portable package and real Windows PE portable package with pinned Python runtime
Safety	No fabricated findings; bounded IPC/images; zeroized credentials; atomic legacy import; no native generic SQL

Current verification

Gate	Recorded result
Legacy frontend	59 tests + type-check + production build passed in Phase 1
Native Rust	12 tests, formatting, Clippy and release build passed after GUI workflow expansion
Python worker	5 tests passed
Ubuntu package	Headless worker/database/icon smoke passed
Ubuntu GUI	Real packaged Wayland launch captured; automated 8-screen lifecycle/worker smoke passed
Windows PE	Cross-build, GUI subsystem and embedded resources verified; latest GUI rebuild pending
Security	RustSec: no vulnerabilities; three unmaintained Linux accessibility transitives

3.1 Verified Ubuntu GUI evidence

Captured by egui's viewport screenshot callback from the packaged native application on the active Ubuntu Wayland desktop. Worker health is OK and missing model weights are shown truthfully.

Automated GUI report: 71 frames, eight navigation screens, worker health observed, passed.

4. Technologies and libraries

Layer	Technology	Purpose
Desktop UI	Rust, eframe, egui	Native cross-platform windowing and immediate-mode UI
Application	Rust std threads/channels	Bounded nonblocking UI controllers and cleanup
Database	SQLite + SQLCipher via rusqlite	Encrypted local patient/examination storage
Key derivation	Argon2id + OS randomness	Password-derived 256-bit database key
AI process	Python 3.13	Persistent local structured worker
Imaging	Pillow + Rust image	Input validation and native display
GPU	Optional PyTorch/CUDA	Detection only today; trained adapter still required
IPC	Versioned JSON Lines	Bounded stdin/stdout messages; no network server
Legacy	React/TypeScript/Tauri	Preserved source for feature migration, not final native runtime
Build	Cargo, PowerShell, Bash, GitHub Actions	Tests and portable Ubuntu/Windows artifacts

Direct dependency declarations (65)

Ecosystem	Dependency	Declared version
Legacy JS	@dnd-kit/core	^6.3.1
Legacy JS	@dnd-kit/sortable	^10.0.0

Rust	thiserror	workspace/local
Rust	zeroize	1

5. Work attribution and provenance

Git commit attribution describes the preserved DIRD+ history. It does not attribute the current uncommitted RetinaCare migration line-by-line.

Commits	Git author identity
193	Nicolás Baier Quezada <15371725+Debaq@users.noreply.github.com>
16	aaron <aaron.mancilla1305@gmail.com>
9	aaronmanc <aaron.mancilla1305@gmail.com>
1	Nicolás Baier Quezada <davil004@gmail.com>

Current local work

The Phase 1/1.5 RetinaCare changes are present only in this local working tree. They were produced through Codex-assisted implementation under the user's direction. No commit author, pull request, or remote publication exists yet, so the report does not invent individual authorship for those changes.

Licensing

The repository retains AGPL-3.0 licensing for DIRD+ and reused code. The native migration must preserve notices. Dataset licenses, model licenses, and patient-data approvals remain separate mandatory checks.

6. Security, privacy, and clinical boundary

Control	Current implementation
Patient data at rest	SQLCipher database under per-user application data
Passwords	Argon2id-derived key; Rust buffers zeroized where practical; password not persisted
Password rotation	Staged salt plus recovery candidates after rekey
Imports	Legacy .dird writes wrapped in atomic Dexie transaction
IPC	Local child process only; request/response sizes, IDs, protocol, status, timeout, and reap enforced
Images	Regular-file, 100 MiB, 40 MP and allocation limits; decode off UI thread
Model output	No diagnosis or findings unless a verified adapter and weights actually return them
Logs	Worker stderr stored locally; never print passwords or patient image bytes

Known gaps

No trained inference adapter, no validated clinical PDF exporter, no signed Windows installer, no Windows execution evidence, no RTX 5070 validation, and no clinical deployment approval. Existing validation assets describe DIRD+ experiments and must not be treated as validation of the new native runtime.

7. Build, package, and operating-system pipeline

Ubuntu development

```
cargo fmt → clippy → workspace tests → release build → package pinned Python/Pillow → headless worker/database/icon smoke → checksum/tar.
```

Windows delivery

```
Cross-build or native Windows Cargo build → embed ICO → bundle isolated Python worker → checksum/ZIP → reboot into Windows → test-windows.ps1 → manual image/database/GPU checklist.
```

Artifact	Location / status
Ubuntu executable	dist/RetinaCare-Ubuntu/RetinaCare
Ubuntu archive	dist/RetinaCare-Ubuntu-x86_64.tar.gz
Windows executable	dist/RetinaCare/RetinaCare.exe
Windows portable ZIP	dist/RetinaCare-Windows-x86_64.zip
Windows smoke	scripts/test-windows.ps1

8. Repository file inventory

Every inventoried file is listed below. Generated distributions, Cargo target output, dependency folders, caches, and Git internals are intentionally excluded because they are reproducible artifacts rather than maintained repository source.

Path	Area / need	Lang	Lines	State	Purpose

9. Remaining work and decisions

Priority	Required next work	Evidence needed
P0	Exercise manual patient/image/report clicks with synthetic data	Screenshots and saved/reopened encrypted examination
P0	Rebuild latest Windows package, boot Windows and run packaged smoke	JSON reports, logs, screenshots, clean-exit observation
P1	Integrate one licensed checksum-pinned trained model adapter	Manifest, hash, label map, preprocessing, validation evidence
P1	Validate RTX 5070 CUDA runtime	Driver/Torch/CUDA versions, device name, VRAM, measured stage timings
P1	Implement clinical PDF reporting	Stable report schema, clinician-review controls, golden-file tests
P2	Complete remaining DIRD+ feature parity	Traceable migration matrix and regression tests

Conclusion

RetinaCare is a real native Rust/Python/SQLCipher migration with working foundations and portable builds, while DIRD+ remains available for reference. The next honest milestone is visual GUI evidence plus Windows/RTX execution, followed by a verified trained-model adapter. Until then, the software must remain research decision support and must not produce or imply clinical diagnoses.
